HEADLINES

- There are currently 22 bumblebee species recorded in Wales and 20 have been recorded in Carmarthenshire.
- Of the five Section 'priority' bumblebee species in Wales, four have been recorded in Carmarthenshire since 2000.
- The Carmarthenshire coastline is particularly important for bumblebees.
- Populations of the Ruderal Bumblebee (*Bombus ruderalis*) were recorded in 2022, having not previously been recorded in the county since 1973.

OVERVIEW

Bumblebees are incredibly important and are found in a broad range of habitats. They are one of the most effective indicators of environmental health and ecological change.

Many species are declining nationwide, with similar declines in Carmarthenshire. Three bumblebee species are considered at risk of local extinction in Carmarthenshire. Data is limited however, and specialised surveys are required to better assess the extent of species in the county.

One of the driving factors affecting bumblebee decline in the UK is the loss of 97% of our ancient wildflower meadows. In the UK two bumblebee species have become extinct since 1940.

Local action, such as that to promote biodiverse grassland via the Carmarthenshire Meadows Group and management of public open space, will have a local benefit.

CURRENT PRESSURES

- Continued land use change, including insufficient or inappropriate management and agricultural intensification, including the isolation and loss of wildflower-rich habitats and traditional hay meadows.
- Insufficient mitigation on development sites.
- Climate change and weather extremes.
- Increased domesticated honeybee populations.
- Non-native invasive species.
- Pollution and pesticides (particularly neonicotinoid pesticides).

RECOMMENDATIONS FOR LOCAL ACTION

- Promote landscape-scale conservation projects targeting threatened/vulnerable bumblebee species.
- Increase flower-rich bumblebee friendly habitats such as hay meadows and floristically diverse road verges.
- Incorporate mitigation and habitat creation for bumblebees (and other pollinators) in all new developments.
